Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to the genomic sequence of Pyrococcus abyssi (see AAF86431 and AAH41223-7) and P. abyssi proteins. P. abyssi is a hyperthermophilit archaeon, which is isolated from deep-sea hydrothermal vents. The present sequence is one such P. abyssi protein. The proteins of the present invention have various potential industrial uses, since the proteins are stable at very high temperatures, some up to 110 degrees centificated.

Note: This patent is in the same patent family as WO200065062, which contains additional sequences as shown in AAB99132-AAB99143,
useful for modulating transcription. The method comprises introducing the cassette into a host cell preferably Agrobacterium by sexual cross, and selecting a host cell with modulated transcription, where the protein is capable of exhibiting at least one of the following biological activities, which include enhanced expression of the protein in a plant results in a delay in flowering time, introduction of the protein into a cell results in modulation of methylation of chromosomal DNA in the cell, reduction of expression of the protein in an Arabidopsis leaf results in expression of the protein in a plant results in enhanced endosperm development and expressing of the protein in an Arabidopsis leaf results in expression of the MEDEA gene. The polynucleotide is useful for detecting a nucleic acid in a sample. DEMETER is related to 5-methylatycosine glycosylases and regulates

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention is related to a Lactococcus lactis nucleotide sequence (ABA9051) and related proteins (ABB5561). The nucleic acid sequence is useful in the detection and/or amplification of nucleic acid sequence, particularly to identify Lactococcus lactis or related species. The proteins of the invention are useful for the biosynthesis or biodegradation of a composition of interest. The invention helps research in lactic bacteria, particularly useful in the production of yogurt and cheese. Moste: The sequence data for this patent is based on equivalent patent WO200177334 (published 18-02-2001) which is available in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New polynucleotide that control plant development comprising a sequence having a specific homology to DEMETER domains A,B or C
protein in an Arabidopsis leaf results in expression of the MEDEA gene. The polynucleotide is useful for detecting a nucleic acid in a sample. DEMETER is related to 5-methylotytosine glycosylases and regulates transcription of target genes by demethylation. The present sequence represents a DMT-like protein.

Also included are an expression cassette comprising the polymucleotide or comprising a heterologous polymucleotide under the control of a promoter at least 70% identical to DMT 5' flanking sequence or an 5' untranslated region of DMT, a host cell comprising an exogenous polymucleotide encoding a DMT-like protein and a transgenic plant comprising a polymucleotide encoding a DMT-like protein. The expression cassette is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           development comprising a sequence domains A, B or C
chromosomal DNA in the cell, reduction of expression of the protein in plant results in enhanced endosperm development and expressing of the protein in an Arabidopsis leaf results in expression of the MEDEA gene. The polynucleotide is useful for detecting a nucleic acid in a sample. DEMETER is related to 5-methylovytosine glycosylases and regulates transcription of target genes by demethylation. The present sequence represents a DMT-like protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             invention relates to an isolated polynucleotide sequence or their

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             complement encoding a polypeptide having a sequence at least 40% identical to DMT (DEMETER, previously known as ATROPOS (ATR)) Domain A, Bo or C or their combinations. Also included are an expression cassette comprising the polymucleotide or comprising a heterologous polymucleotide under the control of a promoter at least 70% identical to DMT 5' flanking sequence, DMT 3' flanking sequence or an 5' untranslated region of DMT, a host cell comprising an exogenous polymucleotide encoding a DMT-like protein and a transgenic plant comprising a polymucleotide encoding a DMT-like protein. The expression cassette is useful for modulating transcription. The method comprises introducing the cassette into a host cell preferably Agrobacterium by sexual
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         cross, and selecting a host cell with modulated transcription, where the protein is capable of exhibiting at least one of the following biological activities, which include enhanced expression of the protein in a plant results in adelay in flowering time, introduction of the protein into a cell results in modulation of methylation of chromosomal DNA in the cell, reduction of expression of the protein in a plant results in enhanced endosperm development and expressing of the protein in an Arabidopsis leaf results in expression of the MEDEA gene. The polynucleotide is useful for detecting a nucleic acid in a sample. DEMETER is related to 5-methylcytosine glycosylases and regulates
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New polynucleotide that control plant development comprising a sequence having a specific homology to DEMETER domains A,B or C

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to an isolated polynucleotide sequence or their complement encoding a polypeptide having a sequence at least 40% identical to DMT (DEMETER, previously known as ATROPOS (ATR)) Domain A, B or C or their combinations. Also included are an expression cassette comprising the polynucleotide or comprising a heterologous polynucleotide under the control of a promoter at least 70% identical to DMT 5' flanking sequence, DMT 3' flanking sequence or an 5' untranslated region of DMT, a host cell comprising an exogenous polynucleotide encoding a DMT-like protein and a transgenic plant comprising a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        polynucleotide encoding a DW-like protein. The expression cassette is useful for modulating transcription. The method comprises introducing the cassette into a host cell preferably Agrobacterium by saxual cross, and selecting a host cell with modulated transcription, where the protein is capable of exhibiting at least one of the following biological activities, which include enhanced expression of the protein in a plant results in a delay in flowering time, introduction of the protein into a cell results in modulation of methylation of chromosomal DNA in the cell, reduction of expression of the protein in a plant results in enhanced endosperm development and expressing of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    comprising a sequence or C

Also included are an expression cassette comprising the polypucleotide or comprising a heterologues or or or their compinations. Also included are an expression cassette comprising the polypucleotide or comprising a heterologues polynucleotide under the control of a promoter at least 70% identical to DMT 5. flanking sequence, DMT 3. flanking sequence or an 5' untranslated region of DMT, a host cell comprising an exceptence or an 5' untranslated region of DMT, a host cell comprision an exception polynucleotide encoding a DMT-like protein. The expression cassette is polynucleotide encoding a DMT-like protein. The expression cassette is useful for modulating transcription. The method comprises introducing the cassette into a host cell preferably Agrobacterium by sexual cross and selecting a host cell with modulated transcription, where the protein is capable of exhibiting at least one of the following biological activities, which include enhanced expression of the protein in a plant results in a delay in flowering time, introduction of the protein in a plant results in a delay in flowering time, control of the protein in a plant results in modulation of expression of the protein in a plant results in enhanced endosperm development and expressing of the protein in an Arabidopsis leaf results in expression of the MEDEA gene.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to identifying target proteins (ABB90790-ABB94016) for herbicidally active compounds, comprising aligning and comparing nucleic acid or amino acid sequences from plant with nucleic acid or amino acid sequences from non-plant organisms using suitable search parameters, where plant sequences having an E-value greater by a factor of 3 than the E-value of most similar non-plant sequences are selected. The polypeptides or nucleic acids encoding them are useful for identifying modulators. The identified modulators are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            comprising aligning and comparing nucleic acid or amino acid sequences from plant with nucleic acid or amino acid sequences from non-plant
     sample.
                                                                                                                                                                                                                                                                                                                                                                  109 IKERGMNNMLAERI-----OSFLNLLVDKHGGIDLEWLRDVPPDQAKEFLLSIRG 158

The polynucleotide is useful for detecting a nucleic acid in a san Babarrer is related to 5-methylcytosine glycosylases and regulates transcription of target genes by demethylation. The present sequence represents a DMT-like protein.
                                                                                                                                                                                                                                                        11;

The invention relates to an isolated polynucleotide sequence or their complement encoding a polypeptide having a sequence at least 40% identical to DMT (DEMETER, previously known as ATROPOS (ATR)) Domain A, B or C or their combinations. Also included are an expression cassette comprising the polynucleotide or comprising a heterologous polynucleotide under the control of a prometer at least 70% identical to DMT, a host cell comprising an exogenous polynucleotide encoding a DMT-like protein and a transgenic plant comprising a polynucleotide encoding a DMT-like protein. The expression cassette is polynucleotide encoding a DMT-like protein. The expression cassette is useful for modulating transcription. The method comprises introducing the protein host cell preferably Agrobacterium by sexual cross, and selecting a host cell with modulated transcription, where the protein is capable of exhibiting at least one of the following bloodycal activities, which include enhanced expression of the protein in a plant results in a delay in flowering time, introduction of the protein in a plant results in an modulation of methylation of chronosomal DNA in the cell, reduction of expression of the protein in an Arabidopsis leaf results in expression of the MEDER general protein in a plant results in expression of the MEDER general to be protein in an Arabidopsis leaf results in expression of the MEDER general teanser general results in expression of the MEDER general to 5-methylcytosine glycosylases and requlates transcription of target genes by demethylation. The present New polynucleotide that control plant development comprising a sequence having a specific homology to DEMETER domains A,B or C Demeter; DMT; Atropos; ATR; 5-methylcytosine glycosylase; DNA demethylation; transgenic plant; transcription modulation; flowering time; endosperm development; MEDEA. Ω

protein in a plant results in a delay in flowering time, introduction of the protein into a cell results in modulation of methylation of chromosomal DNA in the cell, reduction of expression of the protein in a plant results in enhanced endosperm development and expressing of the protein in an Arabidopsis leaf results in expression of the MEDEA gene. The polynuclectude is useful for detecting a nucleic acid in a sample. DEMETER is related to 5-methylcytosine glycosylases and regulates transcription of target genes by demethylation. The present

sequence represents a DMT-like protein.

complement encoding a polypeptide having a sequence at least 40%

Identical to DMT (DEMETER, previously known as ATROPOS (ATR)) Domain A, B

Co or their combinations. Also included are an expression

corsette comprising the polynucleotide or comprising a heterologous

CD OFF 3. Tlanking sequence, DWT 3. flanking sequence or an 5. untranslated

region of DWT, a host cell comprision an exogenous polynucleotide

concoding a DWT-like protein and a transgenic plant comprising a

concoding a DWT-like protein. The expression cassette is

concoding a DWT-like protein. The expression cassette is

concoding a DWT-like protein. The expression cassette is

cuseful for modulating transcription. The method comprises introducing

the cassette into a host cell with modulated transcription, where

cross, and selecting a host cell with modulated transcription of the

cross, and selecting a host cell with modulated transcription of the

cross, and selecting a host cell with modulated transcription of

cross, and selecting a cell results in a modulation of the following

blological activities, which include enhanced expression of the

protein in a plant results in modulation of expression of the protein in a

plant results in enhanced endosperm development and expressing of the

cross protein in an Arabidopsis leaf results in expression of the MEDEA gene.

The polynucleotide is useful for detecting a nucleic acid in a sample.

CT The polynucleotide is useful for detecting a nucleic acid in a sample.

CT The DEMETER is related to 5-methylcycosine glycosylases and expensent

cross or sequence represents a DMT-like protein.

The invention relates to an isolated polynucleotide sequence or their complement encoding a polypeptide having a sequence at least 40% identical to DMT (DEMETER, previously known as ATRODOS (ATR)) Domain A, B crossette comprising the polynucleotide are an expression cassette comprising the polynucleotide or comprising a heterologous polynucleotide under the control of a prometer at least 70% identical to DMT 5′ flanking sequence, DMT 3′ flanking sequence or an 5′ untranslated region of DMT, a host cell comprising an exogenous polynucleotide concoding a DMT-like protein and a transgenic comprising a polynucleotide encoding a DMT-like protein. The expression cassette is useful for modulating transcription. The method comprises introducing the cassettee into a host cell preferably Agrobacterium by sexual the protein is capable of exhibiting at least one of the following the protein in a plant results in adelay in flowering time, introduction of the protein in a plant results in adelay in flowering time, introduction of the protein in an Arabidopsis leaf results in expression of the protein in an Arabidopsis leaf results in expression of the MEDER general The polynucleotide is useful for detecting a nucleic acid in a sample. The polynucleotide is useful for detecting a nucleic acid in a sample. The polynucleotide is useful for detecting a nucleic acid in a sample. Sequence represents a DMT-like protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New polynucleotide that control plant development comprising a sequence having a specific homology to DEMETER domains A,B or C
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                1444 IRERGMNNMLAERI------KDFLNRLVRDHGSIDLEWLRYVDSDKAKDYLLSIRG 1493

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     δ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ò
                                   The invention relates to an isolated polynucleotide sequence or their complement encoding a polypeptide having a sequence at lesst 40% identical to DMT (DEMETER, previously known as ATROPOS (ATR)) Domain A, B or C or their compliations. Also included are an expression cassette comprising the polynucleotide or comprising a heterologous polynucleotide under the control of a prometer at least 70% identical to DMTs flanking sequence, DMTs flanking sequence or an 5' untranslated region of DMT, a host cell comprising an exceptions polynucleotide encoding a DMT-like protein and a transgenic plant comprising a coording a DMT-like protein. The expression cassette is useful for modulating transcription. The method comprises introducing the cassette into a host cell preferably Agrobacterium by sexual cross, and selecting a host cell preferably Agrobacterium by sexual cross, and selecting a host cell with modulated transcription, where the protein in a plant results in a delay in flowering the protein in a plant results in adelay in flowering the protein in a plant results in modulation of methylation of the protein in an Arabidopsis leaf results in expression of the protein in a hanneed endosperm development and expressing of the C protein in an Arabidopsis leaf results in expression of the MEDEA gene. The polynucleotide is useful for detecting a nucleic acid in a sample. Secondary corresponds and requiates
                                                                                                                                                                                                                                                                                                                                                                                                                                       2;

complement encoding a polypeptide having a sequence at least 40% identical to DMT (DEMTER, previously known as ATROPOS (ATR)) Domain A, B corrected to complement encoding a polypeptide having a sequence at least 40% identical to DMT (DEMTER, previously known as ATROPOS (ATR)) Domain A, B cr C or their comprising the polymucleotide or comprising a heterologues polynucleotide under the control of a promoter at least 70% identical to DMT 5. flanking sequence, DMT 3. flanking sequence or an 5. untranslated region of DMT, a host cell comprising an exogenous polynucleotide encoding a DMT-like protein. The expression cassette is polymucleotide encoding a DMT-like protein. The expression cassette is useful for modulating transcription. The method comprises introducing the cassette into a host cell preferably Agrobacterium by sexual cross, and selecting a host cell with modulated transcription, where the protein is capable of exhibiting at least one of the following biological activities, which include enhanced expression of the protein in a plant results in a delay in flowering time, introduction of the protein in an Arabidopsis leaf results in expression of the MEDEA gene. The polynucleotide is useful for detecting a nucleic acid in a sample. The polynucleotide is useful for detecting a nucleic acid in a sample. The polynucleotide is a DMT-like protein. The present
                                                                                                                                                                                                                                                                                                                                                                     New polynucleotide that control plant development comprising a sequence having a specific homology to DEMETER domains A,B or {\tt C}
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to an isolated polynucleotide sequence or their
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           97 XGLKSXECVRLLXLXXXAFPVDTNVGRIXVRXGXVPLXPLPXXXQXHXLXXYPXXXXXQK 156
